DevOps Project Report:
Scientific Calculator

Name: Chahak Agarwal
RollNo: MT2025031

---

1. Introduction to DevOps

DevOps is a collection of flexible practices and processes organizations use to create and deliver applications and services by aligning and coordinating software development with software processes. It uses practices like Continuous Integration(CI) , Continuous Deployment (CD), and automation to reduce errors and improve efficiency in the software development lifecycle.

DevOps help organizations deliver applications quickly ,improve software quality, and respond faster to user needs by enabling better collaboration between development and operations teams.

This project focuses on designing and deploying a Scientific Calculator application using modern DevOps practices.The application is built using Java and supports the following operations:

- **Square root function (√x)**
- **Factorial Function (!x)**
- **Natural Logarithm (ln(x))**
- **Power function (x^b)**

2. Tools Used

Tool	Purpose
GitHub	Source Code Management
JUnit	UnitTesting
Maven	Build Automation
Jenkins	Continuous Integration and Delivery (CI/CD)
Docker	Containerization
DockerHub	Image Registry
Ansible	Automated Deployment

3. Project Setup

Git Commands

- git clone https://github.com/Chahak02/SPE_calculator.git
- git add .
- git commit -m “changes or files added”
- git push origin main

Screenshot 1: (GitHub Repository)

4.Testing With JUnit

- Junit is used to perform unit testing for the scientific calculator functions to ensure that each operations work correctly
- Test cases were written for functions such as power, factorial ,natural log and square root to verify both valid and invalid inputs.
- JUnit assertions like assertEquals and assertThrows were used to check the correctness of result and proper handling of exceptions.

Code Snippet : CalciTest.java

```java
public class CalciTest {  Chahak02
    //  squareRoot Tests
    @Test  Chahak02
    void testSquareRootValid() { assertEquals( expected: 5.0, Calci.squareRoot( n: 25),  delta: 0.0001); }

    @Test  Chahak02
    void testSquareRootNegativeInput() {
        assertThrows(IllegalArgumentException.class, () -> {
            Calci.squareRoot( n: -10);
        });
    }

    //  factorial Tests
    @Test  Chahak02
    void testFactorialValid() {
        // Expected factorial: 5! = 120
        assertEquals( expected: 120, Calci.factorial( n: 5));
        assertEquals( expected: 1.0,Calci.factorial( n: 0));
    }

    @Test  Chahak02
    void testFactorialNegative() {
        assertThrows(IllegalArgumentException.class, () -> {
            Calci.factorial( n: -1);
        });
    }

    @Test  Chahak02
    void testFactorialTooLarge() {
        assertThrows(IllegalArgumentException.class, () -> {
            Calci.factorial( n: 25);
        });
    }
```

```java
    //  naturalLog Tests
    @Test  Chahak02
    void testNaturalLogValid() { assertEquals(Math.log(10), Calci.naturalLog( n: 10),  delta: 0.0001); }

    @Test  Chahak02
    void testNaturalLogZero() {
        assertThrows(IllegalArgumentException.class, () -> {
            Calci.naturalLog( n: 0);
        });
    }

    @Test  Chahak02
    void testNaturalLogNegative() {
        assertThrows(IllegalArgumentException.class, () -> {
            Calci.naturalLog( n: -5);
        });
    }

    // Power Tests
    @Test  Chahak02
    void testPowerValid() { assertEquals( expected: 32.0, Calci.power( base: 2,  exp: 5),  delta: 0.0001); }

    @Test  Chahak02
    void testPowerZeroExponent() { assertEquals( expected: 1.0, Calci.power( base: 10,  exp: 0),  delta: 0.0001); }
}
```

5. Build With Maven

pom.xml configuration

- Added dependencies for JUnit and Maven Plugin
- Configured <mainClass> for executable JAR

Build Command :

mvn clean package

Screenshot 3: Maven Build Output

6. Continuous Integration With Jenkins

Jenkins Pipeline

Stages: Checkout →Build→Test→Docker build/push →Ansible Deployment

Screenshots:

```
pipeline {
    agent any
    environment {
        DOCKER_IMAGE_NAME = 'calculator'
        GITHUB_REPO_URL = 'https://github.com/Chahak02/SPE_calculator.git'
        DOCKER_REGISTRY = 'docker.io'
        DOCKER_USERNAME = 'chahak02'
        IMAGE_TAG = '0.0.1'
    }
    stages {
        stage('Checkout') {
            steps {
                script {
                    git branch: 'main', url: "${GITHUB_REPO_URL}"
                }
            }
        }
        stage('Build and Test') {
            steps {
                script {
                    sh 'mvn clean install'
                }
            }
        }
        stage('Build Docker Image') {
            steps {
                script {
                    // docker.build("${DOCKER_IMAGE_NAME}:${IMAGE_TAG}", '.')
                    // // Optionally, also tag the image as "latest" for consistency
                    // docker.build("${DOCKER_IMAGE_NAME}:latest", '.')
                    def app = docker.build("${DOCKER_IMAGE_NAME}:${IMAGE_TAG}")
sh "docker tag ${DOCKER_IMAGE_NAME}:${IMAGE_TAG} ${DOCKER_IMAGE_NAME}:latest"
                }
            }
        }
```

```
        stage('Push Docker Image') {
    steps {
        withCredentials([usernamePassword(
            credentialsId: 'DockerHubCred',
            usernameVariable: 'USER',
            passwordVariable: 'PASS'
        )]) {

            sh 'echo $PASS | docker login -u $USER --password-stdin'

            sh "docker tag ${DOCKER_IMAGE_NAME}:${IMAGE_TAG} ${DOCKER_USERNAME}/${DOCKER_IMAGE_NAME}:${IMAGE_TAG}"
            sh "docker tag ${DOCKER_IMAGE_NAME}:${IMAGE_TAG} ${DOCKER_USERNAME}/${DOCKER_IMAGE_NAME}:latest"

            sh "docker push ${DOCKER_USERNAME}/${DOCKER_IMAGE_NAME}:${IMAGE_TAG}"
            sh "docker push ${DOCKER_USERNAME}/${DOCKER_IMAGE_NAME}:latest"
        }
    }
}

        stage('Run Ansible Playbook') {
            steps {
                script {
                    ansiblePlaybook(
                        playbook: 'deploy.yml',
                        inventory: 'inventory.ini',
                         extras: "-e tag=${IMAGE_TAG}"
                        // extras: '-K'
                    )
                }
            }
        }
    }
```

```
    post {
        success {
            echo 'Pipeline successfully completed!'
            emailext(
                to:'chahakagarwal02@gmail.com',
                subject: 'Build success: Scientific Calculator',
                body: 'The Jenkins pipeline for the Scientific calculator project has completed successfully.'
            )
        }
        failure {
            echo 'Pipeline failed!'
            emailext(
                to:'chahakagarwal02@gmail.com',
                subject: 'Build failure: Scientific Calculator',
                body: 'The Jenkins pipeline for the Scientific calculator project has failed.'
            )
        }
    }
}
```

Screenshots 4: Jenkins Pipeline

7. Containerization With Docker

Dockerfile

Docker Commands:

- Docker build -t chahak02/calculator:0.0.1 .
- Docker push chahak02/calculator:0.0.1

Screenshot: Docker Image On Docker Hub

8. Deployment with Ansible

Ansible playbook(deploy.yml)

```yaml
---
- name: Deploy Calculator
  hosts: localhost
  connection: local

  vars:
    image_name: chahak02/calculator
    image_tag: "{{ tag }}"
```

```yaml
tasks:

  - name: Install Python dependencies for Docker modules
    pip:
      name:
        - docker
        - requests
      state: present

  - name: Pull Docker image
    docker_image:
      name: "{{ image_name }}:{{ image_tag }}"
      source: pull

  - name: Remove old container if exists
    docker_container:
      name: calculator
      state: absent
      force_kill: true

  - name: Run container
    docker_container:
      name: calculator
      image: "{{ image_name }}:{{ image_tag }}"
      state: started
      restart_policy: always
      tty: true
      interactive: true
```

Inventory File(inventory.ini)

```ini
inventory.ini
[local]
localhost ansible_connection=local ansible_python_interpreter=/Users/veeralagarwal/Documents/MTECH_2/SPE/Calci/Calculator/ansible-env/bin/python ansible_become_pa
```

Screenshot : Ansible Deployment Output

```
Veerals-MacBook-Air:Calculator veeralagarwal$ ansible-playbook deploy.yml -i inventory.ini

---

10. Conclusion

This project demonstrates how to create and implement a '**Scientific Calculator'** using DevOps practices.The integration of GitHub, Maven ,Jenkins, Docker and Ansible ensures efficient and automated software delivery. The project guarantees that the application can be built, tested, packaged, and deployed consistently by incorporating automation into various phases of the

software development lifecycle.The development process is more efficient due to automated pipeline, which also reduces the possibility of human error and manual interactability.
